File: USPT

Dec 18, 2001

DOCUMENT-IDENTIFIER: US 6331235 B1

TITLE: Chiral separation of benzoporphyrin derivative mono-and di-acids by laser-induced fluorescence capillary electrophoresis

Detailed Description Paragraph Right (18):

For BPD stereoisomers, different additives (shown in FIGS. 2A and 2B) HP-.beta.-CD, DM-.beta.-CD, .beta.-CD, and .gamma.-CD, bile salts, .beta.-escin, salicin, sodium rifamycin SV, (+)-rutin hydrate and ammonium glycyrrhizic have been tested as chiral selectors. The bile salts are preferred chiral selector agents. Bile salts are biological surfactants and form small or primary aggregates of 3 to 14 monomers. These aggregates form a type of "inverse micelle" having a negatively charged core and a hydrophobic uncharged surface, which is opposite to that exhibited for sodium dodecyl sulfate (SDS). The amphiphilic nature of bile salts provides both hydrophobic and polar (or electrostatic) sites. The non-polar faces of the monomers aid in solubilizing hydrophobic compounds, and the structurally rigid chiral bile salts selectively interact with BPD enantiomers.

L4: Entry 1 of 1

File: USPT

Sep 17, 1991

DOCUMENT-IDENTIFIER: US 5049389 A

TITLE: Novel liposome composition for the treatment of interstitial lung diseases

Detailed Description Paragraph Right (9):

As defined herein, "phospholipids" include but are not limited to phosphatidic acid (PA) and phosphatidyl glycerol (PG), phosphatidylcholine (PC), egg phosphatidylcholine (EPC), lysophosphatidylcholine (LPC), phosphatidylethanolamine (PE), phosphatidylinositol (PI), and phosphatidylserine (PS). These phospholipids may be fully saturated or partially saturated. They may be naturally occurring or synthetic.

Detailed Description Paragraph Right (10):

The liposome composition may be formulated to include minor amounts of fatty alcohols, fatty acids, and/or cholesterol esters or any other pharmaceutically acceptable excipients with the proviso that these minor lipid components do not significantly reduce the binding affinity of the liposomes for mucosal or lung tissue, are substantially unsaturated, are not toxic or irritating and do not alter the release properties of the drug.

Detailed Description Paragraph Right (17):

Table II illustrates the quantitative composition of the optimal BPD-liposome composition for inhalation.

Detailed Description Paragraph Right (25):

The primary advantage of nonconventional liposomes is their high encapsulation value in particular for steroids. The nonconventional cholesterol sulfate liposomes demonstrate exceptionally high drug loading with encapsulation values up to 100%, when around 10 mole % drug is used with total lipid concentration of around 40 .mu. mol/ml, compared with conventional phospholipid liposomes, which generally allow only about 1-3 mole percent drug encapsulation at a total lipid concentration of 40 umol/ml. For example, unsaturated conventional liposomes without cholesterol have a low encapsulation value with the flexibility of accommodating only 1-3 mole percent of steroidal drug. Saturated conventional liposomes composed of lipid such as fully hydrogenated soy PC do not accommodate even small amounts of the steroidal drug. Even though liposomes containing lyso-PC can accommodate a certain amount of steroid to fill in the acyl chain vacancy, such lyso-PC liposomes containing even as little as 2 mole percent of the steroidal drug exchange and release their drug readily, defeating the whole purpose of drug encapsulation in liposomes (Table I). Encapsulation of steroids into conventional liposomes are thus difficult and a large amount of crystalline steroid could be detected after extrusion and on storage.
